DATE: October 28, 2022 **RE:** 9214

SUBJECT: Supplemental Transportation Impact Assessment
Proposed Age-Qualified Residential Development – 94 West Elm Street
Pembroke, Massachusetts

JSD

Vanasse & Associates, Inc. (VAI) has prepared a supplemental Transportation Impact Assessment (TIA) in support of the proposed age-qualified residential development to be located within the Pembroke Country Club at 94 West Elm Street in Pembroke, Massachusetts (hereafter referred to as the “Project”), in response to a request from the Hanover Planning Board to expand the study area that was assessed in the July 2022 *Transportation Impact Assessment* that was prepared for the Project (the “July 2022 TIA”).¹ Specifically, the Town of Hanover Planning Board submitted a comment letter for consideration by the Pembroke Planning Board that the study area that was assessed in the July 2022 TIA be expanded to include the following intersections: Broadway at Elm Street and Columbia Road (Routes 53 and 139) at Broadway. This supplemental TIA is responsive to this request and supplements and expands the data collection effort and analyses that are presented in the July 2022 TIA.

Based on this supplemental assessment, we have concluded the following with respect to the Project as it relates to impacts within the Town of Hanover:

1. The Project is predicted to add 25 vehicle trips to Elm Street/Broadway within the Town of Hanover during the weekday morning peak-hour and 30 vehicle trips during the weekday evening peak-hour, which represents an increase in peak-hour traffic volumes of less than 3 percent, which is within the range of normal daily traffic volume fluctuations and below the 5 percent threshold of significance that is considered by the Massachusetts Department of Transportation (MassDOT) when establishing the study area for a TIA;
2. The Project will not result in a significant impact (increase) on motorist delays or vehicle queuing over existing or anticipated future conditions without the Project (No-Build conditions), acknowledging that one or more movements at the Columbia Road/Broadway intersection are currently operating at or over capacity (i.e., level-of-service (LOS) “E” or “F”) independent of the

¹*Transportation Impact Assessment*, Proposed Age-Qualified Residential Development; Pembroke Country Club, 94 West Elm Street, Pembroke, Massachusetts; July 2022.

Project, with Project-related impacts at the intersection generally defined as an increase in average motorist delay that resulted in a corresponding increase in vehicle queuing of up to one (1) vehicle; and

3. Independent of the Project, the Columbia Road/Broadway intersection has been designated by MassDOT as a high crash cluster location for 2017-2019 and is included on MassDOT's Top 200 high crash locations (no. 169 out of 200 locations). A Road Safety Audit (RSA) has been conducted at this intersection that included specific recommendations to improve safety.²

Consistent with the findings of the July 2022 TIA and as expanded as a part of this supplemental TIA, we have concluded that the Project can be accommodated within the confines of the existing transportation infrastructure in a safe and efficient manner with the implementation of the recommendations defined in the July 2022 TIA and as expanded as a part of this supplemental assessment.

The following details the findings as they related to the expanded study area intersections within the Town of Hanover.

PROJECT DESCRIPTION

As described in the July 2022 TIA, the Project will entail the construction of 170± age-qualified residential units (162 detached units and eight (8) attached units) to be situated within the Pembroke Country Club at 94 West Elm Street in Pembroke, Massachusetts. In conjunction with the Project, the existing 18-hole golf course will be reconfigured to accommodate the addition of the residential units and the construction of the associated supporting infrastructure, and the clubhouse, restaurant and two (2) function halls will remain.

Access to the Project will be provided as follows:

- **Pembroke Country Club and Attached Residential Units (8 units)** – Pembroke Country Club Drive which intersects the west side of West Elm Street.
- **Pembroke Country Club Home Sites (117± units)** - New roadway that will traverse a general north-south alignment between the existing Pembroke Country Club driveway and Dwelley Street at the location of the existing maintenance driveway for the Pembroke Country Club. The new roadway will include an access control gate at its intersection with the Pembroke Country Club driveway and at a point south of Dwelley Street that will limit the use of the roadway to residents, service/maintenance vehicles and emergency vehicles.
- **Dwelley Street Residences (22± units)** – New roadway that will intersect the south side of Dwelley Street opposite Maple Street.
- **Hazelwood Drive Residences (23± units)** – New roadway that will intersect north side of the cul-de-sac at the terminus of Hazelwood Drive.

In addition, emergency vehicle access drives will be provided to connect the proposed roadways that will be 20-feet wide and constructed with a gravel surface.

²Road Safety Audit, Columbia Road (Routes 53 and 139) at Broadway, Hanover, Massachusetts; June 2021: Old Colony Planning Council.

Off-street parking will be provided for the residential units in individual garages and driveways that will accommodate a minimum of two (2) vehicles per dwelling. Parking for the golf course, clubhouse, restaurant and function halls will be retained as currently provided.

EXPANDED STUDY AREA

The July 2022 TIA included a detailed assessment of Project-related impacts along West Elm Street, Dwelley Street and Oldham Street, and at the following specific intersections: Elm Street at Water Street; West Elm Street at Dwelley Street and Milbery Lane; West Elm Street at Oldham Street; and Oldham Street at Hazelwood Drive. At the request of the Town of Hanover Planning Board, this study area has been expanded to include the following intersections which are depicted on Figure 1A: Broadway at Elm Street and Columbia Road (Routes 53 and 139) at Broadway. This supplemental assessment focuses on potential Project-related impacts at these intersections, the results of which follow and supplement the information that is presented in the July 2022 TIA, which are included by reference herein.

EXISTING CONDITIONS

A comprehensive field inventory of existing conditions within the expanded study area was conducted in September 2022. This inventory included the collection of traffic volume data, as well as a review of existing pedestrian and bicycle accommodations, public transportation services, and motor vehicle crash data. The following summarizes existing conditions within the study area.

Intersection

Table 1 and Figure 2A summarize existing lane use, traffic control, and pedestrian and bicycle accommodations at the expanded study area intersections as observed in September 2022.

Table 1
STUDY AREA INTERSECTION DESCRIPTION

Intersection	Traffic Control Type ^a	No. of Travel Lanes Provided	Shoulder Provided? (Yes/No/Width)	Pedestrian Accommodations? (Yes/No/Description)	Bicycle Accommodations? (Yes/No/Description)
Broadway/Elm St.	S	1 general-purpose travel lane on all approaches	Yes; 1 to 2-feet along all legs	No	Yes; shared traveled-way along Broadway
Columbia Rd./Broadway	TS	1 general-purpose travel lane on Broadway approaches, 2 general-purpose travel lanes on Columbia Rd. approaches	Yes; 1 to 5-feet along all legs	Yes; crosswalks (faded) provided for crossing all legs of the intersection; pedestrian traffic signal equipment and phasing (exclusive) provided	Yes; shared traveled-way along Broadway

^aS = STOP-sign control; TS = traffic signal control.

^bCombined shoulder and travel lane width equal to or exceed 14 feet.

Existing Traffic Volumes

In order to determine existing traffic-volume demands and flow patterns within the study area, turning movement counts (TMCs) and vehicle classification counts were completed in September 2022. The peak period TMCs were performed at the expanded study intersections during the weekday morning (7:00 to 9:00 AM) and evening (4:00 to 6:00 PM) peak periods on Thursday, September 29th, 2022. These time periods were selected for analysis purposes as they are representative of the peak-traffic-volume hours for both the Project and the adjacent roadway network, and are consistent with time periods that are assessed in the July 2022 TIA.

In order to evaluate the potential for seasonal fluctuation of traffic volumes within the study area, MassDOT weekday seasonal factors for Urban Group 4-7 roadways (minor arterials, major collectors, minor collectors, and local roads and streets) were reviewed.³ Based on a review of this data, it was determined that traffic volumes for the month of September are approximately 8.0 percent above average-month conditions. As such, the September traffic volumes did not require a seasonal adjustment as they are representative of above average conditions.

In order to account for the impact on traffic volumes and trip patterns resulting from the COVID-19 pandemic, traffic-volume data collected at MassDOT Continuous Count Station No. 6255, which is located on Route 3, north of Route 18 in Weymouth, in September 2022 was compared to data collected at the same count station in September 2018. The 2018 traffic volumes were expanded to 2019 by applying the traffic growth procedure detailed in the April 2020 “Guidance on Traffic Counting Data” published by MassDOT⁴ in order to allow for a comparison of the data. Based on this pre- and post-COVID-19 traffic-volume comparison, the September traffic volume data that was collected as part of this assessment was found to be within the range of normal daily and seasonal fluctuations that existed prior to the COVID-19 pandemic. As such and with consideration that the September traffic volumes are 8.0 percent higher than those under average-month conditions, a pandemic-related adjustment was not applied to the traffic count data.

The 2022 Existing weekday morning and evening peak-hour traffic volumes at the expanded study area intersections are graphically depicted on Figure 3A.

Pedestrian and Bicycle Facilities

As detailed on Figure 2A, sidewalks are not provided along the study area roadways; however, marked crosswalks (faded) are provided for crossing all legs of the Columbia Road/Broadway intersection, with pedestrian traffic signal equipment and phasing provided. Formal bicycle facilities are not provided within the study; however, Broadway provides sufficient width (combined travel lane and shoulder) to support bicycle travel in a shared traveled-way configuration.⁵

Motor Vehicle Crash Data

Motor vehicle crash information for the expanded study area intersections was provided by the MassDOT Highway Division Safety Management/Traffic Operations Unit for the most recent five-year period available (2015 through 2019, inclusive) in order to examine motor vehicle crash trends occurring within the study area. The data is summarized by intersection, type, severity, roadway and weather conditions, and day of occurrence, and presented in Table 2.

³MassDOT statewide Traffic Data Collection; 2019 Weekday Seasonal Factors, Group U4-7.

⁴*Guidance on Traffic Counting Data*; MassDOT; revised April 2020.

⁵A minimum combined travel lane and paved shoulder width of 14-feet is required to support bicycle travel in a shared traveled-way condition.

^aSource: MassDOT Safety Management/Traffic Operations Unit records, 2015 through 2019.

^bTraffic Control Type: S = STOP-sign control, TS = traffic signal control.

^cCrash rate per million vehicles entering the intersection.

^dStatewide/District crash rate.

^eThe intersection crash rate is significant if it is found to exceed the MassDOT crash rate for the MassDOT Highway Division District in which the Project is located (District 5).

As can be seen in Table 2, the expanded study area intersections were found to have experienced an average of 8.0 or fewer reported motor vehicle crashes over the five-year review period and were found to have motor vehicle crash rates *below* the MassDOT statewide and District averages for similar intersections for the MassDOT Highway Division District in which the intersections are located (District 5). The majority of the crashes were reported to have occurred on a weekday; under clear weather conditions; during daylight; and involved angle or rear-end type collisions that resulted in non-fatal injuries. The detailed MassDOT Crash Rate Worksheets are provided as an attachment.

One motor vehicle crash that resulted in a fatality was reported at the Columbia Road/Broadway intersection. The crash occurred on Friday, November 1st, 2019, at approximately 8:13 PM and involved a vehicle traveling northbound on Columbia Road turning left onto Broadway that collided with a motorcyclist.

A review of the MassDOT high crash location database indicates that the following Columbia Road/Broadway intersection is included on MassDOT's Highway Safety Improvement Program (HSIP) listing as a cluster location 2017-2019 and is also included on MassDOT's Top 200 Crash Location list (no. 169 out of 200 locations). MassDOT defines a HSIP eligible cluster as: "...one in which the total number of 'equivalent property damage only' crashes are within the top 5% in the region." The Equivalent Property Damage Only (EPDO) index is a method of combining the number of crashes with the severity of crashes based on a weighted scale, where a property damage only crash is worth 1 point and injury and fatal crashes are worth 21 points. Designation as a HSIP location allows for MassDOT to prioritize funding for safety-related improvements in a specific region of the state. A Road Safety Audit (RSA) was conducted in 2021 at the Columbia Road/Broadway intersection that provided suggestions for improvements to enhance safety at the intersection.⁶

FUTURE CONDITIONS

Consistent with the July 2022 TIA, traffic volumes at the expanded study area intersections were projected to the year 2029, which reflects a seven-year planning horizon consistent with MassDOT guidelines. Independent of the Project, traffic volumes on the roadway network in the year 2029 under No-Build conditions include all existing traffic and new traffic resulting from background traffic growth. Anticipated Project-generated traffic volumes superimposed upon the 2029 No-Build traffic volumes reflect 2029 Build traffic volume conditions with the Project.

Future Traffic Growth

Future traffic growth is a function of the expected land development in the immediate area and the surrounding region. Several methods can be used to estimate this growth. A procedure frequently employed estimates an annual percentage increase in traffic growth and applies that percentage to all traffic volumes under study. The drawback to such a procedure is that some turning volumes may actually grow at either a higher or a lower rate at particular intersections.

An alternative procedure identifies the location and type of planned development, estimates the traffic to be generated, and assigns it to the area roadway network. This procedure produces a more realistic estimate of growth for local traffic; however, potential population growth and development external to the study area would not be accounted for in the resulting traffic projections.

⁶Ibid 2.

To provide a conservative analysis framework, both procedures were used, the salient components of which are described below.

Specific Development by Others

The Town of Hanover Planning Department was contacted in order to determine if there are any projects planned within the study area that would have an impact on future traffic volumes at the expanded study area intersections. Based on this consultation, the following developments were identified for review in conjunction with this supplemental assessment.

- ***Starbucks Restaurant, 303 Columbia Road, Hanover, Massachusetts.*** This project entails the construction of a 3,360± square foot (sf) Starbucks restaurant with a drive-through facility to be located at 303 Columbia Road, on the southwest corner of the Columbia Road/Broadway intersection and the north of the Project site.
- ***Previte's Marketplace Expansion, 285 Columbia Road, Hanover, Massachusetts.*** This project entails the construction of a 3,000± sf expansion to the Previte's Marketplace located at 285 Columbia Road, on the northwest corner of the Columbia Road/Broadway intersection and north of the Project site.
- ***Oakland Estates Residential Development, Oakland Street, Hanover, Massachusetts.*** This project entails the construction of a nine (9) lot subdivision off of Oakland Street to the north of the Project site.
- ***Nathan Estates Residential Development, Broadway, Hanover, Massachusetts.*** This project entails the construction of a six (6) lot subdivision off of Broadway to the north of the Project site.

Traffic volumes associated with the aforementioned specific development projects by others were developed using trip generation statistics published by the Institute of Transportation Engineers (ITE)⁷ and were assigned onto the study area roadway network based on existing traffic patterns where no other information was available. No other developments were identified at this time that are expected to result in an increase in traffic within the study area beyond the general background traffic growth rate.

General Background Traffic Growth

As described in the July 2022 TIA, a 1.0 percent per year compounded annual background traffic growth rate was used in order to account for future traffic growth and presently unforeseen development within the study area.

Roadway Improvement Projects

The Town of Hanover and MassDOT were contacted in order to determine if there were any planned future roadway improvement projects expected to be complete by 2029 within the study area. Based on these discussions, no roadway improvement projects aside from routine maintenance activities were identified to be planned within the expanded study area at this time.

⁷Ibid 1.

No-Build Traffic Volumes

Consistent with the July 2022 TIA, the 2029 No-Build condition peak-hour traffic-volumes were developed by applying the 1.0 percent per year compounded annual background traffic growth rate to the 2022 Existing peak-hour traffic volumes and adding the traffic volumes associated with the identified specific development project by others. The resulting 2029 No-Build weekday morning and evening peak-hour traffic volumes for the expanded study area intersections are shown on Figure 4A.

PROJECT-GENERATED TRAFFIC

A detailed discussion on the methodology and procedures used to develop Project related traffic volumes is provided in the July 2022 TIA. In summary, the Project is expected to generate 724 vehicle trips on an average weekday (two-way, 24-hour volume, or 362 vehicles entering and 362 exiting), with 58 vehicles trips (19 vehicles entering and 39 exiting) expected during the weekday morning peak-hour and 67 vehicle trips (40 vehicles entering and 27 exiting) expected during the weekday evening peak-hour.

TRIP DISTRIBUTION AND ASSIGNMENT

As described in the July 2022 TIA, the directional distribution of generated trips to and from the Project site was determined based on a review of Journey-to-Work data obtained from the U.S. Census for the Town of Pembroke, and then refined based on existing traffic patterns within the study area. The general trip distribution for the Project within the expanded study area is graphically depicted on Figure 5A. The additional traffic expected to be generated by the Project was assigned on the expanded study area roadway network as shown on Figure 6A for the weekday morning and weekday evening peak-hour.

FUTURE TRAFFIC VOLUMES - BUILD CONDITION

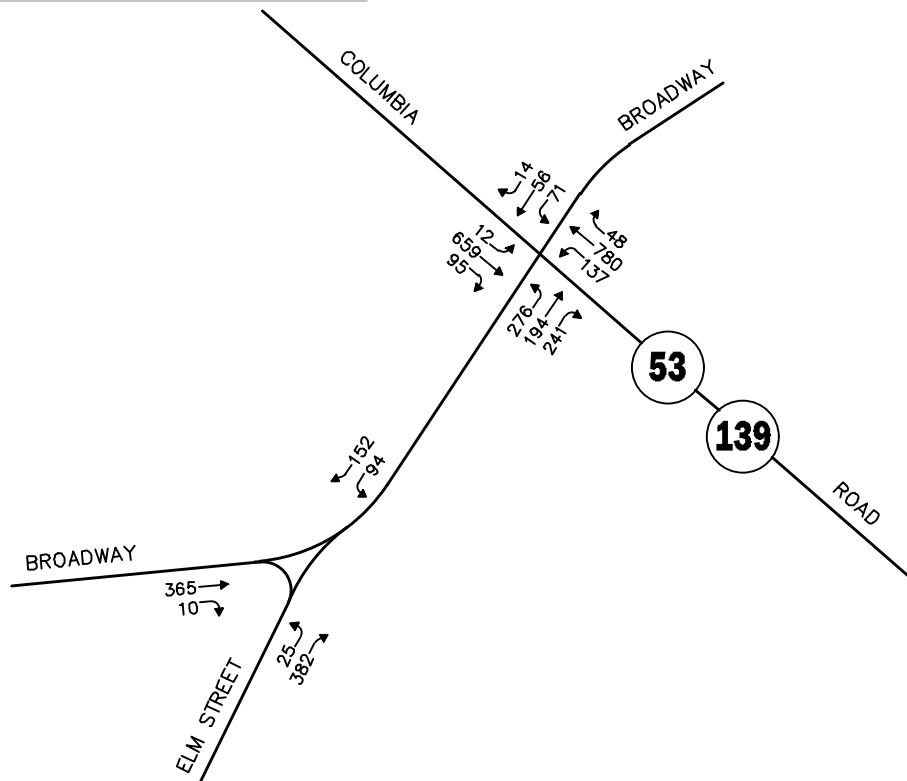

The 2029 Build condition traffic volumes consist of the 2029 No-Build traffic volumes with the additional traffic expected to be generated by the Project added to them. The 2029 Build weekday morning and evening peak-hour traffic volumes for the expanded study area intersections are graphically depicted on Figure 7A.

TRAFFIC OPERATIONS ANALYSIS

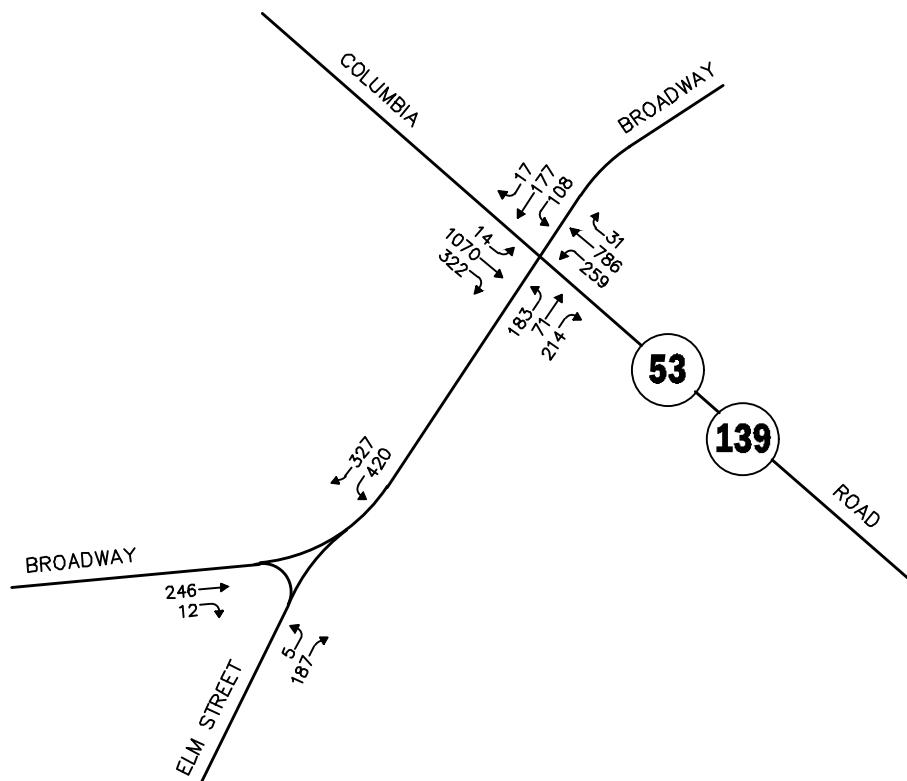

In order to assess the potential impact of the Project on the roadway network, a detailed traffic operations analysis (motorist delays, vehicle queuing, and level-of-service) was performed at the Project site driveway intersection with Pleasant Street. Capacity analyses provide an indication of how well transportation facilities serve the traffic demands placed upon them, with vehicle queue analyses providing a secondary measure of the operational characteristics of an intersection or section of roadway under study.

In brief, six levels of service are defined for each type of facility. They are given letter designations ranging from A to F, with level-of-service (LOS) "A" representing the best operating conditions and LOS "F" representing congested or constrained operations. An LOS of "E" is representative of a transportation facility that is operating at its design capacity with an LOS of "D" generally defined as the limit of "acceptable" traffic operations. Since the level-of-service of a traffic facility is a function of the flows placed upon it, such a facility may operate at a wide range of levels of service depending on the time of day, day of week, or period of the year. The Synchro® intersection capacity analysis software, which is

based on the analysis methodologies and procedures presented in the 2000 Highway Capacity Manual (HCM)⁸ for signalized intersections and in the 2010 HCM⁹ for unsignalized intersection, was used to complete the level-of-service and vehicle queue analyses.

Analysis Results

Columbia Road at Broadway

The addition of Project-related traffic was shown to result in an increase in overall average motorist delay of 6.1 seconds that result in a degradation in overall intersection level-of-service from LOS E to LOS F during the weekday morning peak-hour, with vehicle queuing at the intersection shown to increase by up to one (1) vehicle as a result of the Project. Independent of the Project, overall intersection operations are currently at capacity (i.e., LOS "E") during both peak hours, with the Broadway eastbound and Columbia Road northbound approaches currently operating over their design capacity (i.e., LOS "F") during the weekday morning and evening peak hours, respectively.

Broadway at Elm Street

No change in level-of-service or vehicle queuing is predicted to occur for any movement over No-Build conditions, with all movements continue to operate at LOS D or better and Project-related impacts generally defined as an increase in average motorist delay of up to 1.8 seconds.

SUMMARY

VAI has prepared a supplemental TIA in support of the proposed age-qualified residential development to be located within the Pembroke Country Club at 94 West Elm Street in Pembroke, Massachusetts, in response to a request from the Hanover Planning Board to expand the study area that was assessed in the July 2022 TIA.¹⁰ As requested, this supplemental assessment has evaluated the potential impacts of the Project at the intersections of Broadway at Elm Street and Columbia Road (Routes 53 and 139) at Broadway. Based on this supplemental assessment, we have concluded the following with respect to the Project as it relates to impacts within the Town of Hanover:

1. The Project is predicted to add 25 vehicle trips to Elm Street/Broadway within the Town of Hanover during the weekday morning peak-hour and 30 vehicle trips during the weekday evening peak-hour, which represents an increase in peak-hour traffic volumes of less than 3 percent, which is within the range of normal daily traffic volume fluctuations and below the 5 percent threshold of significance that is considered by the MassDOT when establishing the study area for a TIA;
2. The Project will not result in a significant impact (increase) on motorist delays or vehicle queuing over existing or anticipated future conditions without the Project (No-Build conditions), acknowledging that one or more movements at the Columbia Road/Broadway intersection are currently operating at or over capacity (i.e., LOS “E” or “F”) independent of the Project, with Project-related impacts at the intersection generally defined as an increase in average motorist delay that resulted in a corresponding increase in vehicle queuing of up to one (1) vehicle; and
3. Independent of the Project, the Columbia Road/Broadway intersection has been designated by MassDOT as a high crash cluster location for 2017-2019 and is included on MassDOT’s Top 200 high crash locations (no. 169 out of 200 locations). A Road Safety Audit (RSA) has been conducted at this intersection that included specific recommendations to improve safety.¹¹

Consistent with the findings of the July 2022 TIA and as expanded as a part of this supplemental TIA, we have concluded that the Project can be accommodated within the confines of the existing transportation infrastructure in a safe and efficient manner with the implementation of the recommendations defined in the July 2022 TIA and as expanded follows:

Off-Site

Columbia Road/Broadway

Independent of the Project, overall intersection operations and operating conditions for specific movements at the Columbia Road/Broadway intersection are currently operating at or over capacity (i.e., LOS “E” and “F”, respectively). The addition of Project-related traffic to the intersection was shown to result in a predicted increase in overall average motorist delay over No-Build conditions of up to 6.1 seconds that caused a degradation in overall LOS from LOS E to LOS F during the weekday morning peak-hour and an increase in vehicle queuing of up to one (1) vehicle. In addition, and also independent of the Project, the Columbia/Broadway intersection has been identified by MassDOT as a high crash cluster location for 2017-2019 and the intersection is included on MassDOT’s Top 200 high crash locations (no. 169 out of 200 locations). A RSA was conducted at the intersection in 2021 that include specific suggestions for improvements to enhance safety.

¹⁰Ibid 1.

¹¹Ibid 2.

In an effort to off-set the predicted impact of the Project and to enhance safety at the Columbia Road/Broadway intersection, the Project proponent will design and implement an optimal traffic signal timing plan, with a specific emphasis on the yellow all-red clearance intervals (the timings most closely associated with motorist and pedestrian safety) prior to the issuance of a Certificate of Occupancy for the Project and subject to the receipt of all necessary right, permits and approvals.

2018 Average Count Data – Sta. 6255

September ADT: 134,159

Growth Rate (2018-2019): 0.0% [MassDOT Yearly Growth Rates (U1-Southeast)]

Adjusted 2019 Calculations

$$134,159 \times (1 + 0.000) = 134,159$$

Adjusted September ADT: 134,159

2022 Average Count Data – Sta. 6255

September ADT: 135,121

COVID Adjustment

$$1 - \frac{134,159}{135,121} = 0.007$$

September Volumes are 0.7% above Pre-COVID conditions

Intersection Summary	

Actuated Cycle Length: 78

Natural Cycle: 145

Control Type: Actuated-Uncoordinated

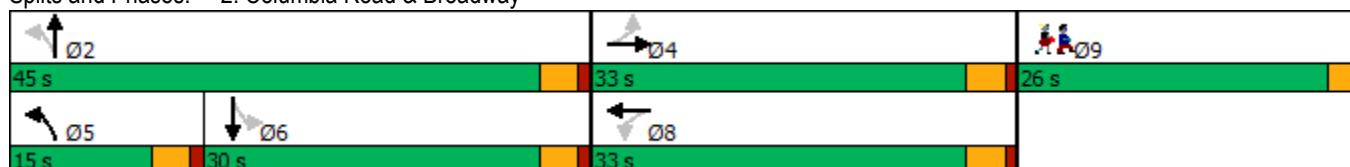

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.
