Massachusetts Department of Public Health

Outline

1. Harmful Algae Blooms
2. MDPH Guidelines
3. Environmental Monitoring Program
4. Lessons Learned
5. Future Efforts

Harmful Algae Blooms

- Blue-green algae/cyanobacteria occur in aquatic ecosystems
- Highly concentrated in water: harmful algae bloom (HAB)
- Ability to produce toxins
- Human and animal health concerns

MDPH Guidelines

- Established cyanobacteria guidelines in 2008
- MDPH recommends an advisory when:
 - A cyanobacteria scum is present
 - A cell count exceeds 70,000 cells per milliliter of water
 - A microcystin level exceeds 14 parts per billion
- Advisories remain in place until levels remain below guidelines

MDPH Guidelines

CAUTION

PUBLIC HEALTH ADVISORY

CYANOBACTERIA BLOOM PRESENT

**Waterbody Unsafe for
People and Pets**

-  Do not swim.
-  Do not swallow water.
-  Keep animals away.
-  If you have any contact with water, rinse off immediately.

Call your local health department with questions:

Additional info on algae can be found at:
www.mass.gov/dph/algae

Environmental Monitoring

- MDPH established an environmental monitoring program for recreational waterbodies:
 - Monitoring strategy
 - Sampling and analysis protocol
 - Data evaluation
 - Recommendations

Monitoring Strategy

- Two types of HAB monitoring:
 - Routine
 - Response
- Once detected, samples collected weekly until advisory rescinded

Sampling and Analysis

- Sample collection:
 - Chose location based on likelihood of exposure
 - Fill 1L amber bottle at a location 6 inches below the water surface, in 3 feet of water
- Water quality parameters collected in the field included:

■ Air and water temp.	■ Salinity
■ Secchi disk depth	■ pH
■ Dissolved oxygen	■ Turbidity

Sampling and Analysis

- Photographs are taken to record surface water observations
- Samples are shipped to a private laboratory for analyses:
 - Genera identification
 - Genera cell count
 - Microcystin level

Results

- From 2009-2014, 1,075 samples were collected from 75 waterbodies in 58 municipalities
- One-third of samples exceeded the cell count guideline
- The dominant genera in the exceeding samples were primarily *Anabaena*, *Aphanizomenon*, and *Microcystis*
- Less than 1% exceeded the microcystin guideline

***Anabaena* Blooms**

***Microcystis* Blooms**

- MDPH recommended a total of 97 public health advisories

Advisory Length

- In general, these advisories lasted less than 60 days

Advisory Issuance by Month

- Majority of advisories issued in July and August

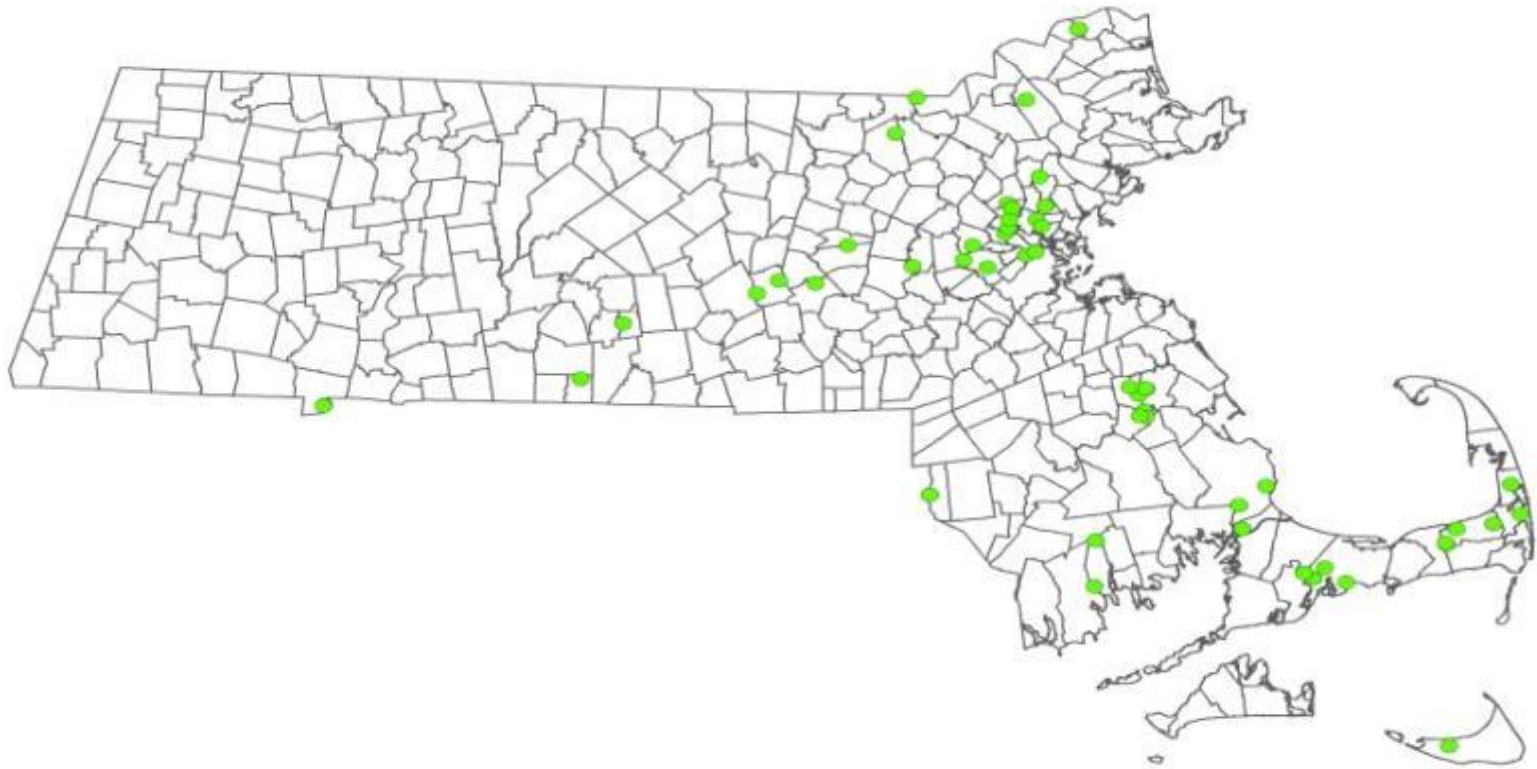

Advisory Locations

- Locations tend to be in Eastern Massachusetts

Lessons Learned

- HABs are a common in Massachusetts
 - Tend to be concentrated in eastern Massachusetts
 - Most frequently occur in the summer months
 - May continue into the fall
- Mutual reliance
 - MDPH relies on local officials/residents to report blooms
 - Local officials rely on MDPH to provide technical and analytical support
- Monitoring is resource intensive

Lessons Learned

- Photographs are important!
 - A significant number of blooms are identified by photographed scums
 - Helps to limit responding to issues that are clearly not HAB-related

Likely a HAB

Not Likely a HAB

Lessons Learned

- Great deal of public interest in this issue
- Sampling of media reports from 2015:

High algae counts close West Monponsett Pond

JULY 21, 2015 BY DEBORAH ANDERSON, EXPRESS STAFF

The Halifax Board of Health has closed West Monponsett Pond to fishing, boating and water recreation in the wake of an algae count slightly higher than the level recommended by the Commonwealth.

The BCH tests the water of each pond weekly on Tuesdays, with the results back to the town on Thursdays. The last test showed West Monponsett Pond at 75,000 cells/ml, slightly higher than the maximum recommended of 30,000 cells/ml.

BROOKLINE

Residents are being told to keep their dogs from swimming out of the Brookline Reservoir after state health officials found blue-green algae floating on the surface.

Toxic algae closes down Jamaica Pond

By Alexandra Kuchuk
GLASS COVINGTON JUNE 24, 2015

The Boston Public Health Commission has issued a health advisory and halted all water activities at Jamaica Pond because of a recent growth of toxic algae in the water, officials said.

Visitors to the pond will not be allowed to swim, boat, or fish, or let their dogs swim in or drink from the water for as long as the algal bloom persists, the health commission said in a statement.

Future Efforts

- Harmonize MDPH guidelines with evolving federal guidance
- Use data for development of predictive models
- Continue to provide analytical and technical assistance to local health officials, requesting agencies, and others
