Project Narrative
50 Mattakesett Street
Pembroke, Massachusetts

Project Summary

The project proponent proposes to construct one new warehouse building at 50 Mattakesett Street, Pembroke, MA. The property is shown as Pembroke Assessor’s Parcel C9-23E and is approximately 1.5 acres. The property has frontage on Mattakesett Street and is abutted by developed residential properties. The property slopes to the southwest, northwest, and northeast towards the abutting residential properties.

The proposed stormwater system is comprised of a stormwater basin and a roof drywell system. The systems will provide groundwater recharge of stormwater roof runoff and control the rates and volumes of runoff.

Pre-Development Condition

The site is currently comprised of an office building, paved parking lot, concrete walkway, woods, lawn and landscaped areas. The property currently has a stormwater system consisting of catch basins and leaching pits located in corners of the parking lot.

Soil information was obtained from the Soils Conservation Services (SCS) Survey of Plymouth County, Massachusetts and on-site soil testing. Based on SCS Soils Mapping the soils are classified as “427B – Newfields fine sandy loam, 3 to 8 percent slopes” (Hydrologic Soil Group B).

Post-Development Condition

In the post-development condition stormwater analysis, the same watershed areas were analyzed for the purpose of analyzing the rates and volumes of runoff from the proposed new storage unit buildings, and driveways. The proposed stormwater system is comprised of a roof drywell system with an overflow to an infiltration basin. The system will provide groundwater recharge, treatment of driveway runoff and control the rates and volumes of runoff. Refer to Watershed Delineation Plan WS-2 for a delineation of post-development drainage subareas. The design points for the post-development design condition correspond to the design points for the pre-development design condition and are shown on Plans WS-1 and WS-2.

The stormwater management system was designed to be in compliance with the DEP Stormwater Management Policy to the extent practicable.
Erosion and Siltation Control

The potential for temporary impacts to downgradient properties and/or wetlands due to erosion and migration of sediments will be mitigated by adherence to basic erosion control practices. These include:

1. Install staked mulch sock and/or silt fence (as directed by Conservation Agent) at the upland edge of the limit of work as shown on the Site Plan. This erosion control barrier shall be installed prior to earthwork at the site. An additional stockpile of siltation fence, and stakes will be stored on site for use in repairing the erosion control barrier as needed. Inspections of the erosion control barrier shall be made weekly and after all significant rainfall events.

2. Clearly define the limits of work in the field in order to minimize the extent of clearing and soil disturbance.

3. Re-grade, loam and seed exposed soil areas immediately following construction.
SUMMARY OF STORMWATER STANDARDS 1 – 10
(50 Mattakeesett Street, Pembroke, MA)

Standard #1: *No new stormwater conveyances (i.e. outfalls)*...

The project complies as it does not propose any new stormwater outfalls. Stormwater in the existing and proposed conditions flows overland in a southwesterly direction towards the abutting properties. It is the intent of the proposed design to follow the natural/existing conditions stormwater flow paths to the extent practicable. Proposed roof runoff will be directed to a roof drywell system and the driveway runoff will be directed to rain garden.

Standard #2: *Post-Development peak discharge rates do not exceed pre-development rates*...

The project has been designed to mitigate peak rates and volumes of runoff. See below for calculations of the runoff discharges and volumes for the 2, 10 and 100-yr. storm events.

**Peak Discharge Rates (cfs):**

**Design Point #1:**

Standard #3: *Loss of annual recharge to groundwater shall be eliminated*...

There is no loss of annual recharge to groundwater because the project proposes an infiltration basin and system of roof drywell chambers designed to infiltrate runoff.

Recharge Volume = 0.35 inches of runoff X Increased Impervious Area** (Hydrologic Soil Group B)

The redevelopment results in an increase of 4,000 s.f. of impervious roof area, all of which is directed to an infiltration BMP.
Therefore  Minimum Recharge Volume = 0.35 in. x 4,000 s.f. X (1 ft./12 in.) = 117 c.f. (min.)

**PROVIDED RECHARGE = 342.4 c.f.**
(Provided within 32 ADS Arc-36HC Chambers, at 10.7 c.f./chamber)

**Standard #4: Stormwater management systems shall remove 80% of the average TSS.**

Requirement: Provide 80% TSS Removal of the Water Quality Volume.

Water Quality Volume (WQV) = 1 inches of runoff X new driveway impervious areas*

Therefore:  Minimum WQV = 1 inches X 0 s.f. X (1 ft./12 in.) = 0 c.f. (min.)

**PROVIDED = 3,436 c.f. (Provided within rain garden)**
(Additional TSS removal calculation worksheets are included in this report for the proposed rain garden (90% TSS removal) and pretreatment systems (44% TSS removal))

*Total impervious area for Std. 4 Calculation is not required to include roof runoff, as roof runoff is considered clean and free of suspended solids (non-metal roof is proposed).

**Standard #5: Stormwater discharges from Land Uses with Higher Potential Pollutant Loads**

Not applicable. An office building is not a land use with higher potential pollutant loads.

**Standard #6: Stormwater discharges to critical areas...**

Property is located in the Water Resource and Groundwater Protection District Zone III. Additional pretreatment has been utilized though the use of a peastone diaphragm and sediment forebay.

**Standard #7: A redevelopment project is required to meet standards...only to the extent practicable**

The project is considered to be a partial redevelopment. The project has been designed to comply with all standards.

**Standard #8: Erosion & Sedimental Control Plan**

An Erosion & Sedimentation Control plan is submitted in Appendix A of this report.

**Standard #9: A Long Term Operation & Maintenance Plan shall be developed...**

A Post-Construction Operation & Maintenance Plan is submitted in Appendix A of this report.

**Standard #10: All illicit discharges to the stormwater management system are prohibited.**

An illicit discharge compliance statement is submitted in Appendix A of this report.

JPC / Pembroke Realty Trust
137 Washington Street
Norwell, MA 02061
781-659-7273

Contractor:

____________________________
____________________________
____________________________

Inspection & Record Keeping:

The responsible party shall maintain an operation and maintenance log during construction to control construction-related impacts, including erosion, sedimentation and other pollutant sources and land disturbance activities.

The anticipated time to complete this project is twelve months. The responsible party shall inspect the construction site at least once every 14 calendar days and within 24 hours of a storm event of ½ inch or greater. Inspections shall be performed until the site is fully stabilized and the temporary sedimentation controls have been removed. The inspector shall inspect each measure to determine if it was installed/performed correctly. The inspector shall also determine if the measures have been damaged and if so the corrective action.

The log shall kept on-site at all times and shall be made available to MassDEP and the Conservation Commission upon request. Member and agents of MassDEP and the Conservation Commission shall be allowed to enter and inspect the premises to evaluate and ensure that the responsible party complies with the Operation and Maintenance Plan requirements for each BMP.
Operation & Maintenance:

Land disturbance activities for this project include constructing the proposed storage unit buildings and associated driveways, grading, lawn, landscaping and stormwater systems. During land disturbance and construction activities, project proponents must implement controls that prevent erosion, control sediment movement, and stabilize exposed soils to prevent pollutants from moving offsite. Construction activities increase the potential for erosion and sedimentation at a site which may adversely impact wetland resource areas. To prevent this impact, the following conditions shall be imposed to control erosion and sedimentation:

Stabilization Practices: Disturbed areas shall be stabilized and protected as soon as practicable. Disturbed areas shall be stabilized when construction activity in the area has ceased for more than 14 days unless not feasible due to snow cover or if construction activities will resume within 21 days after construction temporarily ceased. Stabilization measures include the following:

- Temporary seeding
- Geotextiles
- Mulching and Netting
- Permanent seeding

Stormwater Control Manager ________________________________
Long-Term Operation & Maintenance Plan
Best Management Practices
50 Mattakeesett Street
Pembroke, MA

Responsible Parties & Contact Information:

Owner:

JPC/Pembroke Realty Trust
137 Washington Street
Norwell, MA 02061
781-659-7273

Record Keeping:

The responsible party shall maintain an operation and maintenance log for a minimum of three years prior including inspections, repairs, replacement and disposal. The log shall be kept on-site at all times.

The log shall be made available to MassDEP and the Conservation Commission upon request. Members and agents of MassDEP and the Town shall be allowed to enter and inspect the premises to evaluate and ensure that the responsible party complies with the Operation and Maintenance Plan requirements for each BMP.

Operation & Maintenance:

In order to maintain the integrity of the stormwater management system, frequent inspections and maintenance shall be performed by the owner. The BMPs require continuous inspections and maintenance in order to function properly. The BMPs should be inspected and maintained as specified and after all major storm events.

Gutter & Downspout Systems shall be inspected quarterly. Material observed within any gutter or downspout shall be removed and disposed of in accordance with all applicable local, state and federal regulations. Inspect for signs of overflow to the surcharge pipe. It is recommended that “gutter guards” be installed on the roof gutter system to prevent leaves and tree debris from entering the subsurface system.

Infiltration Basin shall be checked for infiltrative capacity on a quarterly basis and after any significant rainfall event. Trash, leaves, branches, etc. shall be removed from basin and channel areas. Silt, sand and sediment, if significant accumulation occurs, shall be removed by hand annually. Material shall be removed and disposed of in accordance with all applicable local, states and federal regulations. Care shall be taken to maintain vegetation growth within a basin. Grass shall be cut and weeds and brush removed or trimmed at regular intervals during the growing season. Reseeding and weed control may need to be performed periodically to maintain healthy, dense vegetation and maintain the pollutant removal efficiency of the basin. Any slope erosion within the basins shall be stabilized and repaired as soon as practical. Mowing shall be performed frequently enough to keep the vegetation in vigorous condition and to control encroachment of weeds and woody vegetation, however it should not be mowed too closely so as to reduce the filtering effect. Mowing shall be performed with a bag attachment to prevent the compaction of cut grass and occur at a minimum of two times per year. The basins shall be monitored immediately after each two year storm event to
verify that they fully drain within a 72-hour period. If it is found that the basin is not sufficiently drained, the basin shall be inspected by a Professional Engineer and the underlying gravel layer should be removed and replaced as overseen by a Professional Engineer.

Important items to check during inspection include: signs of differential settlement, cracking, erosion, leakage in the embankments, tree growth on the embankments, condition of riprap, sediment accumulation and the health of the turf.

**Roof Drywells** shall be checked for infiltrative capacity on a quarterly basis and after any significant rainfall event. Additional inspections should be scheduled during the first few months to make sure that the chambers are exfiltrating within 72 hours of all storms. It is recommended that “gutter guards” be installed on the roof gutter system to prevent leaves and tree debris from entering the subsurface system. Material observed within any roof drywell shall be removed and disposed of in accordance with all applicable local, states and federal regulations.

**Anticipated Operation and Maintenance Cost:**
The annual anticipated operation and maintenance cost is approximately $1,500.00.
**Project Location:** 50 Mattakeesett Street, Pembroke, MA

MOUNDING ANALYSIS VARIABLES

\( R \) (100 – Year) = Recharge (Infiltration Rate) (Ft/Day)
Infiltration rate was determined to be the quantity of water discarded in a 100-year storm over the drain time of the system.
\( R = \frac{0.075 \text{ ac.ft.} \times 43,560 \text{ s.f./ac.}}{761 \text{ s.f. system footprint} \times (24 \text{ hours} \times 1\text{day/24 hours})} = 4.3 \text{ ft/day} \)

\( Sy \) = Specific Yield
Value per Table for Specific Yield of Various Geologic Materials (From Morris and Johnson 1967).
\( Sy = 21\% = 0.21 \)

\( K \) = Horizontal Hydraulic Conductivity
Vertical soil permeability is assumed to be one-tenth of the horizontal hydraulic conductivity.
Vertical soil permeability was determined to be 2.41 in/hour = 4.82 ft/day
Therefore \( K = 48.2 \text{ ft/day} \)

\( X \) and \( Y \) = \( \frac{1}{2} \) Length and Width of Basin

\( T \) = Duration of Infiltration Period, Days
The designed system has a drain down time of 20 hours = 0.3 days

\( hi \) = Initial Saturated Thickness
Determined from the nearest well per the MassDEP Well Database.
Bedrock was recorded at 110’ at #43 Mattakesett Street

MOUNDING ANALYSIS SUMMARY

A mounding analysis was performed for the rain garden.

The rain garden will fully drain in 8 hours. Refer to Draw Down Calculations.

The rain garden is proposed with 2’ of separation from the bottom of the basin to seasonal high groundwater. The mounding analysis reports 0.407’ of mounding at the center of the basin. Therefore, the mounding analysis demonstrates that the mound that forms under the rain garden will not break out.
This spreadsheet will calculate the height of a groundwater mound beneath a stormwater infiltration basin. More information can be found in the U.S. Geological Survey Scientific Investigations Report 2010-5102 "Simulation of groundwater mounding beneath hypothetical stormwater infiltration basins".

The user must specify infiltration rate (R), specific yield (Sy), horizontal hydraulic conductivity (Kh), basin dimensions (x, y), duration of infiltration period (t), and the initial thickness of the saturated zone (h(i)(0), height of the water table if the bottom of the aquifer is the datum). For a square basin the half width equals the half length (x = y). For a rectangular basin, if the user wants the water-table changes perpendicular to the long side, specify x as the short dimension and y as the long dimension. Conversely, if the user wants the values perpendicular to the short side, specify y as the short dimension, x as the long dimension. All distances are from the center of the basin. Users can change the distances from the center of the basin at which water-table aquifer thickness are calculated. Cells highlighted in yellow are values that can be changed by the user. Cells highlighted in red are output values based on user-specified inputs. The user MUST click the blue "Re-Calculate Now" button each time ANY of the user-specified inputs are changed otherwise necessary iterations to converge on the correct solution will not be done and values shown will be incorrect. Use consistent units for all input values (for example, feet and days).

Re-Calculate Now

Disclaimer

This spreadsheet-solving the Hantush (1967) equation for ground-water mounding beneath an infiltration basin is made available to the general public as a convenience for those wishing to replicate values documented in the USGS Scientific Investigations Report 2010-5102 "Groundwater mounding beneath hypothetical stormwater infiltration basins" or to calculate values based on user-specified site conditions. Any changes made to the spreadsheet (other than values identified as user-specified) after transmission from the USGS could have unintended, undesirable consequences. These consequences could include, but may not be limited to: erroneous output, numerical instabilities, and violations of underlying assumptions that are inherent in results presented in the accompanying USGS published report. The USGS assumes no responsibility for the consequences of any changes made to the spreadsheet. If changes are made to the spreadsheet, the user is responsible for documenting the changes and justifying the results and conclusions.
MOUNDING ANALYSIS VARIABLES

\[ R \ (100 \text{ – Year}) = \text{Recharge (Infiltration Rate) (Ft/Day)} \]
Infiltration rate was determined to be the quantity of water discarded in a 100-year storm over the drain time of the system.
\[ R = \frac{(0.049 \text{ ac.ft. x 43,560 s.f./ac.})}{628 \text{ s.f. system footprint} \times (24 \text{ hours} \times 1 \text{day/24 hours})} = 3.4 \text{ ft/day} \]

\[ Sy = \text{Specific Yield} \]
Value per Table for Specific Yield of Various Geologic Materials (From Morris and Johnson 1967).
\[ Sy = 21\% = 0.21 \]

\[ K = \text{Horizontal Hydraulic Conductivity} \]
Vertical soil permeability is assumed to be one-tenth of the horizontal hydraulic conductivity.
Vertical soil permeability was determined to be 2.41 in/hour = 4.82 ft/day
Therefore \[ K = 48.2 \text{ ft/day} \]

\[ X \text{ and } Y = \frac{1}{2} \text{ Length and Width of Basin} \]

\[ T = \text{Duration of Infiltration Period, Days} \]
The designed system has a drain down time of 20 hours = 0.3 days

\[ hi = \text{Initial Saturated Thickness} \]
Determined from the nearest well per the MassDEP Well Database.
Bedrock was recorded at 110’ at #43 Mattakessett Street

MOUNDING ANALYSIS SUMMARY

A mounding analysis was performed for the drywell.

The drywell will fully drain in 7 hours. Refer to Draw Down Calculations.

The drywell is proposed with 2’ of separation from the bottom of the basin to seasonal high groundwater. The mounding analysis reports 0.140’ of mounding at the center of the structure. Therefore, the mounding analysis demonstrates that the mound that forms under the drywell will not break out.
This spreadsheet will calculate the height of a groundwater mound beneath a stormwater infiltration basin. More information can be found in the U.S. Geological Survey Scientific Investigations Report 2010-5102 “Simulation of groundwater moundings beneath hypothetical stormwater infiltration basins”.

The user must specify infiltration rate (R), specific yield (Sy), horizontal hydraulic conductivity (Kh), basin dimensions (x, y), duration of infiltration period (t), and the initial thickness of the saturated zone (hi(0), height of the water table if the bottom of the aquifer is the datum). For a square basin the half width equals the half length (x = y). For a rectangular basin, if the user wants the water-table changes perpendicular to the long side, specify x as the short dimension and y as the long dimension. Conversely, if the user wants the water-table changes perpendicular to the short side, specify y as the short dimension, x as the long dimension. All distances are from the center of the basin. Users can change the distances from the center of the basin at which water-table aquifer thickness are calculated.

Cells highlighted in yellow are values that can be changed by the user. Cells highlighted in red are output values based on user-specified inputs. The user MUST click the blue “Re-Calculate how” button each time ANY of the user-specified inputs are changed otherwise necessary iterations to converge on the correct solution will not be done and values shown will be incorrect. In the report accompanying this spreadsheet, (USGS SIR 2010-5101), vertical soil permeability (ft/d) is assumed to be one-tenth horizontal hydraulic conductivity (ft/d).

---

**Disclaimer**

This spreadsheet-solving the Hantush (1967) equation for groundwater mound beneath an infiltration basin is made available to the general public as a convenience for those wishing to replicate values documented in the USGS Scientific Investigations Report 2010-5102 “Groundwater moundings beneath hypothetical stormwater infiltration basins” or to calculate values based on user-specified site conditions. Any changes made to the spreadsheet (other than values identified as user-specified) after transmission from the USGS could have unintended, undesirable consequences. These consequences could include, but may not be limited to: erroneous output, numerical instabilities, and violations of underlying assumptions that are inherent in results presented in the accompanying USGS published report. The USGS assumes no responsibility for the consequences of any changes made to the spreadsheet. If changes are made to the spreadsheet, the user is responsible for documenting the changes and justifying the results and conclusions.
V(bottom to outlet) = 1200 CF

Time = \frac{1200 \text{ CF}}{2.41 \text{ in/hr} \times \frac{761 \text{ SF}}{1 \text{ in}} \times \frac{1 \text{ hr}}{2 \text{ in}}} = 7.9 \text{ HRS}

7.9 \text{ HRS} \leq 72 \text{ HRS}

Drywell

Time = \frac{832 \text{ CF}}{2.41 \text{ in/hr} \times \frac{628 \text{ SF}}{1 \text{ in}} \times \frac{1 \text{ hr}}{12 \text{ in}}} = 6.6 \text{ HRS}

6.6 \text{ HRS} \leq 72 \text{ HRS}
A. Introduction

A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:
- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.\(^1\) This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8\(^2\)
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

\(^1\) The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

\(^2\) For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.
B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer’s Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Registered Professional Engineer Block and Signature

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

☐ New development

☐ Partial

☒ Redevelopment

☐ Mix of New Development and Redevelopment
Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

- No disturbance to any Wetland Resource Areas
- Site Design Practices (e.g. clustered development, reduced frontage setbacks)
- Reduced Impervious Area (Redevelopment Only)
- Minimizing disturbance to existing trees and shrubs
- LID Site Design Credit Requested:
  - Credit 1
  - Credit 2
  - Credit 3
- Use of “country drainage” versus curb and gutter conveyance and pipe
- Bioretention Cells (includes Rain Gardens)
- Constructed Stormwater Wetlands (includes Gravel Wetlands designs)
- Treebox Filter
- Water Quality Swale
- Grass Channel
- Green Roof
- Other (describe):

Standard 1: No New Untreated Discharges

- No new untreated discharges
- Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth
- Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.
Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.
☒ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.
☒ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☒ Soil Analysis provided.

☒ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☒ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field

☐ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☒ Runoff from all impervious areas at the site is not discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume only to the maximum extent practicable for the following reason:

☐ Site is comprised solely of C and D soils and/or bedrock at the land surface

☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000

☐ Solid Waste Landfill pursuant to 310 CMR 19.0000

☐ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

1 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.
Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☑ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☑ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:
- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☑ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☑ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:
- ☐ is within the Zone II or Interim Wellhead Protection Area

☐ is near or to other critical areas

☐ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)

☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☑ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.
Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☒ The BMP is sized (and calculations provided) based on:

☐ The ½" or 1" Water Quality Volume or
☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☐ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted prior to the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does not cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has not been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☐ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☐ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☒ Critical areas and BMPs are identified in the Stormwater Report.
Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☒ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

☐ Limited Project

☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.

☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area

☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff

☐ Bike Path and/or Foot Path

☒ Redevelopment Project

☐ Redevelopment portion of mix of new and redevelopment.

☐ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☐ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☒ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.
Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has **not** been included in the Stormwater Report but will be submitted **before** land disturbance begins.

☒ The project is **not** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☐ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted **BEFORE** land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

☒ Name of the stormwater management system owners;

☒ Party responsible for operation and maintenance;

☒ Schedule for implementation of routine and non-routine maintenance tasks;

☒ Plan showing the location of all stormwater BMPs maintenance access areas;

☒ Description and delineation of public safety features;

☒ Estimated operation and maintenance budget; and

☒ Operation and Maintenance Log Form.

☐ The responsible party is **not** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

☐ A copy of the legal instrument (deed, homeowner’s association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;

☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☐ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☒ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted **prior to** the discharge of any stormwater to post-construction BMPs.
